

Source currency and reporting coverage

25 September 2026. A dated audit of upstream data versions and a refreshed descriptive supplement. No heat-association model has been refitted.

What changed

The San Diego Police Department (SDPD) partial 2026 offense file increased from **56,793 to 57,037 records: a net addition of 244**. It now contains occurrence dates through 24 September. Of the increase, 95 records belong to the added 24 September date and a net 149 revise 26 earlier dates. Two daily totals decreased. This is a mutable administrative series, not simply a daily append. [1]

Source	Freshness finding
California Department of Justice	Five retained data/context files unchanged; current catalog still covers through 2025. Reporting-gap qualifications remain.
San Diego Association of Governments	Fourteen aggregate/dictionary responses unchanged. Retained scientific metadata fields unchanged despite four raw metadata hash differences.
SDPD	2020-2025 files unchanged. Partial 2026 source revised to 57,037 records; refreshed daily and monthly aggregates reconcile to that total.
National Oceanic and Atmospheric Administration	Sixteen daily files changed; checked 1991-2025 and 2021-2024 records unchanged. Sixty hourly archive files unchanged.
Census	The retained 2020 population table unchanged. These remain 2020 counts, not current estimates.
Sheriff / Open-Meteo	Sheriff direct listings blocked; latest indexed report contents unverified. Open-Meteo documentation checked; full reanalysis responses not reacquired.

Request log: 133 web resources, 131 responses and two access failures. A successful response is not proof of complete data coverage. Exact web addresses, Coordinated Universal Time (UTC) timestamps, response hashes and comparison scopes are public. [2: full audit]

Interpretation and reproducible outputs

The refreshed file is a separate outcome

SDPD offense records are not Sheriff arrest records, unique victims or domestic-violence cases. Its documented schema has no explicit domestic-violence flag. The refresh extends contextual aggregate material; it does not extend the user-supplied arrest export or repair its unknown reporting gaps. Partial 2026 is excluded from the existing fitted study.

Statistical conclusions remain versioned

The fitted civil-day maximum-temperature results in the corrected 64-postal-area reference analysis (63 fitted postal areas for domestic violence) are unchanged: general eligible arrest-record groups, +1.91% per 10 degrees Fahrenheit ($p = 0.05287$); domestic-violence groups, +2.74% ($p = 0.17903$). Neither primary test meets a 0.05 threshold. These estimates do not establish no association or a causal effect. The fixed sensitivity battery has no test below 0.05 after Holm adjustment. [3: [study methods and results](#)]

Historical National Oceanic and Atmospheric Administration checks do not certify unchanged Open-Meteo reanalysis values: the complete reanalysis panel was not downloaded again, and previously quota-limited locations remain unresolved. No new data correction, extrapolation or effect model is implied.

Aggregate reconciliation and privacy

The refreshed release contains 1,335 daily group/category cells and 416 monthly offense cells; each aggregation reconciles to 57,037 source rows. Distinct case counts are cell-specific and must not be summed as unique cases across cells. Record-level source bytes were processed in memory; published outputs exclude case identifiers, addresses and coordinates.

A second source retrieval matched the audited 2026 file hash. The public allowlist contains the aggregate comma-separated values (CSV) and JavaScript Object Notation (JSON) files, provenance and checking code. Live refreshes are new audits because upstream data change. Offline checks validate the saved reconciliation. [4: [explicit file allowlist](#)]

The supplied arrest data remain incompletely characterized by the agency. Direct Sheriff access failures prevent certification of its latest monthly series. This supplement reports verified retrieval results and gaps; it does not claim absolute completeness or external peer review.
